

[COMBAT REFRESHER TRAINING - UK]

Iqarus was tasked with delivering advanced medical pre-deployment refresher training to members of specialised military units. The primary goal was to refresh and validate the medical capabilities of combat-ready troops, preparing them for deployment into high-risk operational environments.

The training teams at Iqarus were challenged to design and execute 16 concurrent high-fidelity simulated scenarios, each uniquely tailored to meet the specific needs of this specialised unit. Each scenario was repeated twice per learner, allowing them to demonstrate their ability to provide medical care under intense, realistic conditions typical of a kinetic operational environment. After each scenario, Iqarus instructors, who were appropriately qualified and experienced, provided constructive feedback, performance analysis, and guidance to enhance the trainees' skills.

The Iqarus training management team engaged with military command elements early in the planning process to clearly define the required outcomes, establish appropriate assessment methodologies, and manage client expectations.

As a result, the training and assessment were highly regarded, with positive feedback from both the deploying troops and their commanders. The program was recognised as extremely effective in preparing the unit for the challenges they would face in the field.
